VICTOR ATIYEH
GOVERNOR

OFFICE OF THE GOVERNOR
STATE CAPITOL
SALEM, OREGON 97310

November 6, 1985

Victor Atiyeh
Governor of Oregon

Agriculture in Oregon is a vital, dynamic industry, providing a wide diversity of agricultural products known for quality in markets, both here and abroad.

By producing these basic agricultural products, our state's reliable farmers and ranchers generate important economic benefits for all Oregonians. They create countless thousands of jobs both on and off the farm, as value is added to the products through processing, transportation and marketing.

As Governor of Oregon, I have always been proud of the great accomplishments of our farmers and ranchers in not only providing food and fiber, but for creating general economic benefits for all Oregonians.

These achievements as reported in these 1984-1985 OREGON AGRICULTURAL STATISTICS, serve to reinforce that pride.

Sincerely,

Victor Atiyeh
Governor

DIRECTOR'S VIEWPOINT

Why Agriculture is Oregon's Largest Industry

Leonard Kunzman
Director
Oregon Department of
Agriculture

**By Leonard Kunzman, Director,
Oregon Department of Agriculture**

By any measure Agriculture is Oregon's largest industry — a giant economic engine that generates around 13 billion dollars annually of economic activity, and creates hundreds of thousands of jobs for urban and rural Oregonians.

The nearly 2 billion dollar 1984 "farm gate" value of Oregon's agricultural production, reported in these agricultural statistics is just the tip of the iceberg, giving an incomplete picture of the actual economic contribution agriculture makes to Oregon's economy.

To get a more complete picture of the huge economic contribution agriculture makes to Oregon's economy factors such as production, processing, marketing and distribution need to be factored in.

Most national studies, establish the value added — through the various steps from farm to table — at seven times the farm gate value of the raw agricultural product. Applying this guideline puts agriculture's 1984 contribution to Oregon's economy at nearly 13.7 billion dollars.

That is almost 40% of Oregon's estimated total annual economic activity, or gross state product of $34.5 billion dollars.

This huge contribution is reliable and steady, having increased each year since statistics have been kept, and by 5% since 1982. To a large extent Oregon agriculture's reliability is due to the skill of our farmers and ranchers and their ability to produce a wide range — some 172 in all — of high quality agricultural products.

While we hear of wholesale flight from the farm in other areas of the United States, Oregon has actually **increased** the number of farms every year since 1970. This fact speaks to the long-term prospects of agriculture in Oregon.

Those prospects appear bright as we approach the 21st century. In the next decade, we will find Oregon farmers and ranchers with an even more diversified crop and product mix. Oregon farmers and ranchers will continue their leadership in finding profitable new markets, and expanding existing markets for their high quality products.

I am sure as well that we will find Agriculture continuing as Oregon's largest and leading industry, a tradition it has maintained since Oregon was founded by farmers and ranchers nearly a hundred and fifty years ago.

These 1984 Agricultural Statistics show where Oregon Agriculture has been during the past years, and hopefully will provide the detailed information that all of us in agriculture will need to chart a successful course for the future.

As a final word, on behalf of all of Oregon agriculture I would like to thank all of those involved for the dedicated work that went into putting this edition together.

FOREWORD

This bulletin is the year end product of an excellent cooperative program between the Oregon Department of Agriculture and the Oregon Statistical Reporting Service of USDA. Our joint effort to provide the data needs of Oregon agriculture in the most efficient manner possible is done under the familiar name of the Oregon Crop and Livestock Reporting Service. The extent of this cooperation is better understood when one realizes that all of our field enumerators are hired and paid through the National Association of State Departments of Agriculture. It's a truly remarkable system that works well not only in Oregon, but in all 50 states.

This publication fills many needs. The data helps:

- producers make sound production and marketing decisions
- foreign and domestic buyers locate consistent supply areas
- companies make decisions on plant and outlet locations
- legislators address agricultural problems
- commodity groups and commissions set policies and programs

We extend "special thanks" to all of the voluntary reporters who provided the basic information for this publication. Without their cooperation and support this bulletin would not be possible. In addition, we wish to thank the Oregon State University Extension Service and their county agents for helping supply county data.

This bulletin is designed to provide the agricultural data you need. We welcome any suggestions for future issues.

Sincerely,

Paul M. Williamson

Paul M. Williamson
Statistician In Charge

1/ Jan. 1, 1985 Inventory.
2/ Dec. 1, 1984 Inventory.

GENERAL

The value of all 1984 agricultural commodities produced in Oregon, at $1.98 billion, increased 2 percent from the 1983 value of $1.94 billion and gained 5 percent over the 1982 value. All commodity groups posted a modest gain from the previous year except the field crops and berries. The grain, forage and miscellaneous field crops were down 1 percent while the berries dropped 17 percent. Grain, forage and miscellaneous field crops remained dominant in value even though it declined $6 million but still represents 35 percent of Oregon's total agricultural value of production during 1984.

Oregon's importance and contribution to the total national agricultural output is the wide diversity of it's products, many of which are produced almost exclusively in Oregon.

1/ Data for calendar year

1984 SEASON REVIEW

The last week of December 1983 temperatures dropped into the teens in many areas west of the Cascades, causing damage to berry plantings and fruit trees. January brought continued cold temperatures at the higher elevations of eastern Oregon, where winter wheat fields without snow cover suffered some damage. Western areas and the Columbia Basin were warmer than normal. The entire state was much drier than normal during the month. February continued the cold spell in the east. Other areas had temperatures slightly above normal. Rainfall for the month was slightly above average over most of the state. The continued warm weather allowed much seeding of spring grains in the Willamette Valley. Precipitation during March was also above normal. The entire state had temperatures above normal. In the Willamette Valley, caneberry training, fruit tree spraying and grain fertilizing all proceeded nicely. Potato planting began in the Hermiston-Boardman area early in the month. Early season tree fruits started their bloom by the end of March.

The wet spring continued in April, making it difficult for Willamette Valley vegetable growers to seed their crops. Temperatures were cooler than normal over the entire state, causing some concern about fruit set, particularly at Hood River and The Dalles. The weather also hampered spring grain seeding. Spraying and fertilizing advanced slowly between showers. A cold spell during the last days of the month caused some damage to cherries in Wasco County. Temperatures in May were mostly cooler. Above normal rainfall continued. By month's end the winter wheat crop was just over half headed compared to about two-thirds on average. Spring grain seeding was nearly complete even at the highest elevations of the east. With continued wet, cool weather in June, disease problems in western winter wheat fields peaked. Timely rains in the east aided the condition of grain crops. Splitting of cherries was also a rain related problem. Willamette Valley vegetables developed much later than normal. Haying was often interrupted by showers.

July was hot and dry, not unusual for Oregon. By the end of the month, winter wheat was about one-fifth harvested compared to an average of 30 percent. Sweet cherries were nearly all picked; the crop was very poor due to splitting. Potato harvest began in the Hermiston-Boardman area. Vegetable harvest was behind normal, but the crops were very good. Drier than normal weather continued in August in the west. Eastern areas received above average rainfall for the month. By mid-month Bartlett pear harvest had started. Grass seed harvest was complete by the end of August. During September temperatures and precipitation were slightly below normal. Winter wheat harvest was completed by the first of the month. By the second week, Bartlett pear harvest was complete and winter pear picking had started. Winter wheat seeding began on schedule.

October was wetter and cooler than normal. Winter wheat seeding was slowed by the rains. Potato and onion harvests were rain delayed in the Willamette Valley. Cranberry harvest went very well and was completed by the end of October. Near record amounts of rain fell in many western locations during November. All regions of the state received greater than normal precipitation. Most of the state averaged cooler than normal. Apple harvest was completed by the second week. Filbert harvest was slowed by rains and wasn't complete until December, although precipitation was below normal for the month. Temperatures were much below the long term average. Some Willamette Valley wheat growers were unable to get their winter wheat in by the end of the year. A few potatoes in Klamath County were left undug because of snow cover. Some strawberry fields were damaged by freezing weather.

FIELD CROPS

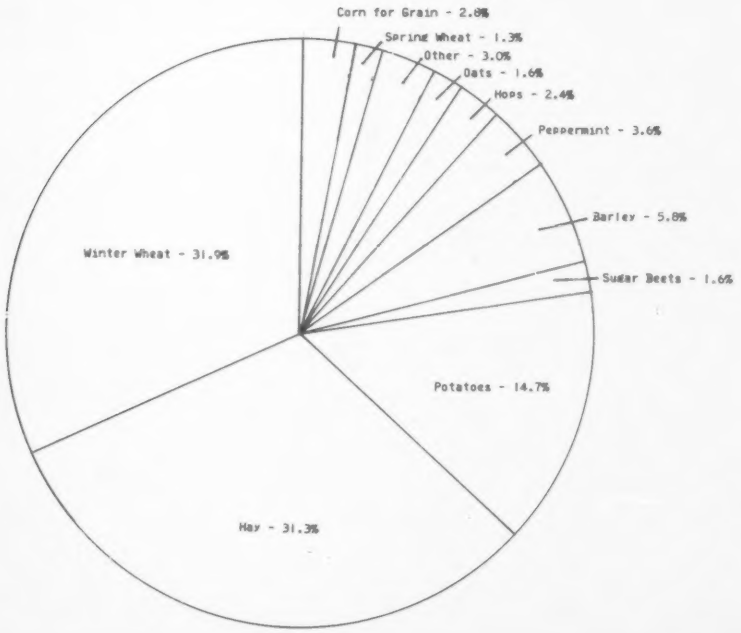
A warm, dry September provided excellent field work conditions but below normal soil moisture caused seeding in the fall of 1983 to get off to a slow start. Rains in early October improved conditions but contributed to some cheatgrass problems in Eastern Oregon. Snow cover provided good protection from record-breaking sub-zero winter temperatures. A wet, cool spring slowed crop development somewhat and led to disease problems. A clearing and warming trend in late May aided grain-filling and sparked spring planting activity. June continued cool and wet which, despite slowing the maturing process, contributed to excellent crop growth. A warmer and drier than normal July provided excellent conditions for harvest of small grains and, with excellent soil moisture, led to good growth and development of other field crops.

Record setting yields averaging 63 bushels per acre were obtained by Oregon's winter wheat farmers in 1984. The increase in yields along with an increase in harvested acres led to a 7 percent larger crop in 1984 than in 1983, for the third largest crop on record. Farmers harvested nearly one-fourth less spring wheat in 1984 despite the record 43 bushels per acre yield, as they combined the fewest acres since 1972.

The 1984 barley crop was 5 percent more than the 1983 crop. The 62 bushels per acre yield was tied for the second largest on record. A record 88 bushels per acre average yield in 1984 led to a 10 percent larger oat crop. Oregon corn growers had the highest average grain yield in the country in 1984, while harvesting the largest acreage ever in the state. These two factors combined for a record large corn crop, 25 percent larger than in 1983.

Sugarbeet production in 1984 was down 3 percent from 1983 despite a 3 percent increase in harvested acres. Oregon surpassed Maine to become the third largest fall potato producing state in 1984, with 10 percent more harvested than in 1983. Production of all hay was only slightly off the 1983 record. Hop production was the lowest since 1969, 31 percent lower than the 1983 crop. An 8 percent increase in peppermint oil production was due to the 9 percent increase in harvested acreage, as the average yield was off 1 pound per acre.

VALUE OF PRODUCTION: PERCENT OF TOTAL, BY FIELD CROPS, OREGON, 1984



MAJOR FIELD CROPS: Acreage, Production and Value

1/ Preliminary. 2/ Fresh-weight basis. 3/ Includes flour. 4/ Includes potatoes canned in soups, stews, and other combinations.

FRUIT AND NUTS

Oregon filberts staged a comeback in 1984, increasing 65 percent from 1983's disastrous crop, but remaining 28 percent short of 1982's record. Weather was the major factor in determining crop size. Cool, wet weather prevailed during pollination, reducing the set, while excessive rains hampered harvest efforts, leaving some nuts in the mud. Despite the small crop, prices remained low due to foreign competition. Oregon produced 99 percent of the domestic filberts, but accounted for only 3 percent of the world total.

Oregon's 1984 utilized production of tree fruits declined 19 percent from 1983, but total value increased 2 percent. The state ranked third in all pear production in 1984, contributing 22 percent of total U.S. utilized production. Pears other than Bartletts declined 15 percent from 1983; however, the price improved $100 per ton, resulting in a 30 percent increase in total value. Bartlett pear production declined for the third consecutive year to 70 percent of the 1983 crop. Again, price improvement offset the decline in production so that the value of the crop increased by 2 percent.

The 1984 sweet cherry crop was 30 percent below the record crop of 1983. Despite a price increase of $5 per ton, the value of the crop decreased by 29 percent. Oregon ranked fourth nationally in sweet cherry production with 18 percent of the U.S. total. Tart cherry production dropped 73 percent from 1983. A price decline dropped the value 80 percent.

The 1984 Oregon apple crop was 16 percent smaller than in 1983, dropping the state to tenth in the U.S. The price improved $2 per ton, but total value still declined 16 percent. Prune and plum production dropped for the fourth consecutive year to the lowest total since 1972. This is a drop of 28 percent from 1983. Total value was down 25 percent. Peaches were the only fruit to show a production increase in 1984, up 8 percent.

VEGETABLES

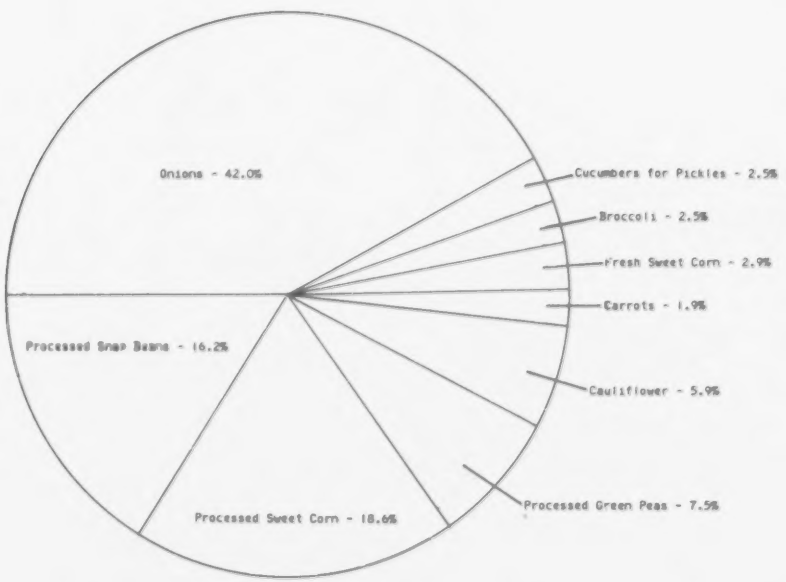
Fresh Market and Dual Purpose

Production of fresh market and dual purpose vegetables in 1984 increased 26 percent from 1983 and 23 percent from 1982. The total value of these crops declined 5 percent from the previous year, but was over twice the total value of two years earlier. Very low onion prices accounted for the low value in 1982. Oregon ranked ninth among the states in acreage of fresh market vegetables harvested, fifth in production and seventh in value for these crops. Fresh market and dual purpose vegetables accounted for 44 percent of Oregon's total vegetable production and 57 percent of total value.

Processing

Production of processing vegetable crops in 1984, including cucumbers for pickles reinstated to the estimating program for 1984, totaled 567.5 thousand tons. These crops were harvested from 101,400 acres and their total value came to 62.6 million dollars. Oregon's ranking among the states for processing vegetable crops was fourth in acreage harvested, in production and in value. Production of snap beans, sweet corn and green peas for 1984, at 543.5 thousand tons, was up 10 percent from 1983 but down 6 percent from two years earlier. The value of these crops increased from the prior year by 20 percent and from 1982 by less than one-half of one percent. Sweet corn acreage, yield and price were all up in 1984. Snap bean acreage increased more than enough to offset a small drop in yield, and the price was up 11 percent from a year earlier. Green pea acreage was down slightly but yield went up 26 percent and price was up 22 percent. After being omitted from the estimating program in 1982 and 1983, cucumber acreage planted and harvested came to 1,900 acres in 1984. Production of cucumbers for pickles totaled 24.0 thousand tons.

VALUE OF PRODUCTION: PERCENT OF TOTAL, BY VEGETABLE CROP, Oregon, 1984



Onions - 42.0%
Cucumbers for Pickles - 2.5%
Broccoli - 2.5%
Fresh Sweet Corn - 2.9%
Carrots - 1.9%
Cauliflower - 5.9%
Processed Green Peas - 7.5%
Processed Sweet Corn - 18.6%
Processed Snap Beans - 16.2%

BERRIES

All of Oregon's berry crops in 1984 showed decreases in production from 1983 except red raspberries and cranberries. Red raspberry production was up 6 percent from 1983. The most drastic production declines were: loganberries, down 42 percent; black raspberries, down 31 percent; and strawberries, down 24 percent. Acres harvested were relatively stable with some crops up and others down. The yield per acre declined for every berry crop, except cranberries. The yield decrease explains much of the drop in production for most crops.

Oregon berry growers received a higher price in 1984 compared with the previous year for all crops except strawberries and blueberries. The boysenberry price more than doubled from 1983. Black raspberries were priced 80 percent higher in 1984 than the previous season. These two crops showed the largest percentage increases in price. The prices of strawberries and blueberries declined 36 percent and 26 percent, respectively. The Oregon cranberry crop improved from 1983. Acreage harvested increased by 8 percent and the average yield per acre improved by nearly 1 barrel per acre, resulting in a 9 percent increase in production.

The 1984 season was shaped by the extreme cold weather during the last week of December 1983, which caused significant freeze damage to most berry crops. Strawberry fields were particularly hard hit with freeze damage. The strawberry crop was further damaged by several nights of frost during the peak of the bloom period.

LIVESTOCK

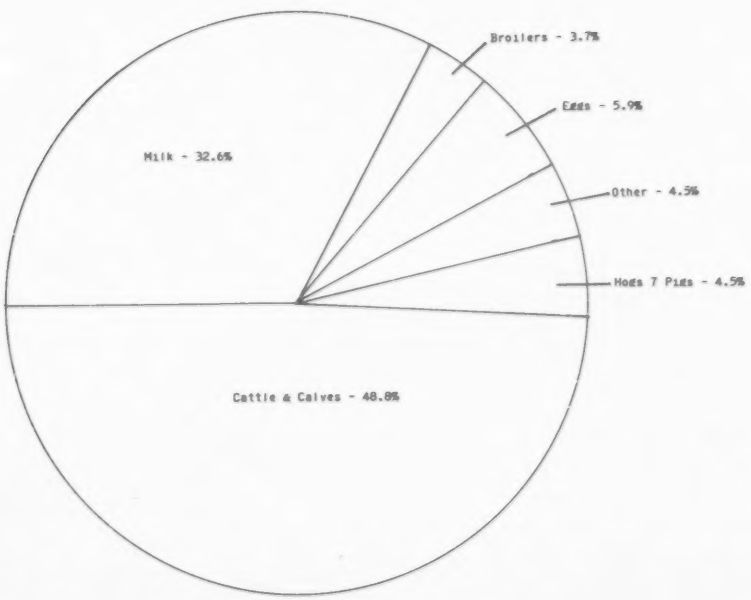
During 1984, the total value of production for all livestock, dairy and poultry products was $569 million, an increase of $ 4.7 million over 1983. All major livestock groups increased in value of production except milk which dropped in value by $8.3 million. Oregon livestock products account for approximately three dollars of farm income out of every ten dollars the farmers and ranchers receive.

Nearly half the livestock value of production each year comes from raising cattle and calves. In 1984, this production value increased 1.5 percent. Cattle and calf inventory value, however, was 1 percent lower at year's end than on January 1, 1984. Cattle marketings increased 18 percent over 1983 up to 481 thousand head. The average price per 100 pounds for cattle marketed increased $1.80 over last year to $48.70 per 100 pounds.

Oregon's dairy industry accounts for roughly one-third of the livestock value of production. In 1984, its value of production decreased 4 percent below the record high level of 1983. This is the first yearly decrease since 1964. Lower prices and fewer milk cows on Oregon's farms made dairy the only major livestock item to decline in value from last year. During most of 1984 the government's milk diversion program was in effect in an effort to lower milk production.

Poultry products value of production also increased in 1984. Layer numbers were virtually unchanged from last year; however, both the rate of lay and the price per dozen of eggs increased, causing an increase in the value of eggs produced. Broiler production increased 400,000 birds over last year while the price per pound was slightly lower. Overall, the value of broiler production increased slightly over 1983's value level. Turkey value of production increased $1.4 million over 1983's level which was the lowest value of turkeys produced in Oregon since 1972. More turkeys were raised last year and growers received a higher price per pound resulting in the increased value of production.

VALUE OF PRODUCTION: PERCENT OF TOTAL, BY LIVESTOCK GROUPS, Oregon 1984



Hog and Pig numbers and the number of sows farrowing remained unchanged from 1983 levels. However, the number of pigs per litter did increase, raising the annual pig crop 13,000 head, resulting in increased marketings. The 1984 value of production increase over 1983 was only 5 percent due to a slight price drop.

Sheep and lamb value of production for Oregon during 1984 had the largest increase of any livestock group over 1983, a large gain of 25 percent. This increase was due to 21 percent more lambs being marketed during the year and by an improved price per 100 pounds of $6.60, up to $56.80 per 100 pounds. Total wool production decreased last year in Oregon. However, the price per pound of wool increased 22 cents per pound, boosting the wool value of production by 22 percent over last year.
